

RPR Automated

Multi-Channel Automation & Profit Intelligence System

Amazon (MayflowerMobile) + eBay (Jectronics)

Prepared by	Rayhan Khan, Pakshal Gandhi, Ryan Gallagher
Technical Lead	Pakshal Gandhi
Prepared for	Jameson Blangiardo, Owner — Jectronics LLC
Business	Jectronics LLC / MayflowerMobile
Location	Plymouth, Massachusetts
Date	March 2026

Executive Summary

Jectronics LLC, operating under the brand MayflowerMobile on Amazon, is an established multi-channel resale business based in Plymouth, Massachusetts. The company sources overstock items, store returns, and surplus inventory and resells them across eBay (since 2006) and Amazon (since 2019).

With over 238,000 items sold on eBay alone and Top Rated Seller status on Amazon, Jectronics manages a high-volume, multi-platform operation with a small team. This creates a specific operational challenge: tracking what is profitable across sales channels, managing fluid resale inventory, and maintaining visibility into margins when product costs vary by lot.

This proposal outlines RPR Automated — a purpose-built, affordable automation and analytics system designed specifically for Jectronics. Built in Python with a Streamlit web dashboard and a Claude AI chat interface, RPR Automated will:

- Centralize sales data from Amazon and eBay into one dashboard, updated automatically
- Run entirely on a cloud server — no dedicated on-site hardware required, accessible from any browser on any device
- Track inventory separately across your warehouse, FBA In Transit, and FBA Available — never confusing what you hold with what Amazon holds
- Calculate true profit per item after purchase cost, Amazon and eBay fees, FBA fulfillment fees, and shipping
- Allow the owner to ask questions about sales and inventory in plain English via a built-in AI chat interface
- Send automated email alerts when stock is low, a product hits zero, an FBA shipment is delayed, or sales drop unexpectedly — no login required to receive them
- Automate daily and weekly reporting so the owner spends less time pulling data manually
- Identify which channels and categories generate the best margins

Pricing in this proposal reflects the actual scale of a small, owner-operated resale business — not an enterprise retailer. RPR Automated uses open-source tools with no licensing fees and runs at under \$74/month in operating costs.

Business Profile — What We Know About Jectronics

The following profile was compiled from publicly available marketplace data and business directories. Understanding the business model is essential to designing a system that actually fits the operation.

Detail	Information
Legal Business Name	Jectronics LLC
Owner	Jameson Blangiardo
Location	Plymouth, Massachusetts
Business Model	Resale — overstock, store returns, and surplus inventory
eBay Store Name	Jectronics (seller since 2006)
eBay Items Sold	238,000+ with 99–100% positive feedback
Amazon Brand Name	MayflowerMobile (registered trademark Dec 2024)
Amazon Seller Since	2019 — Top Rated Seller
Team Size	Approximately 2 employees
Product Categories	Gaming, Mobile, Wearables, Electronics, Clothing, Books, Sporting Goods

Why the Resale Model Matters for System Design

A resale and liquidation business has different data needs than a traditional retailer. Key differences that shape RPR Automated's design:

- Inventory is fluid — lots change frequently, so the system must handle variable acquisition costs per batch using FIFO costing
- Margins vary more than in standard retail — some lots are highly profitable, others are thin, making per-item profit tracking essential
- The same SKU may sell for different prices across channels — cross-channel pricing visibility is valuable
- Stockouts are harder to predict — there is no automatic reorder with a supplier, so proactive alerts matter more
- Fee structures differ across Amazon FBA, Amazon Direct, and eBay — all three must be accounted for separately in profit calculations
- FBA stock and warehouse stock must never be conflated — a unit sent to Amazon is still your asset but is no longer available to fulfil directly

The Problem RPR Automated Solves

Challenge	Business Impact	How RPR Automated Helps
Data lives in 2 separate platforms	Hours spent monitoring Amazon and eBay separately	Single dashboard pulls all channels together automatically
True profit is hard to calculate	Revenue looks good but fees, shipping, and lot costs vary	Profit calculated per item including all cost inputs
Inventory levels hard to track	Risk of underbuying or overbuying stock	Real-time inventory monitoring with low-stock alerts
FBA stock visibility	Unclear how many units are at Amazon vs. in warehouse	Separate FBA and warehouse tracking with live status
No demand forecasting	Difficult to know which categories to restock and when	Sales velocity data shows what moves fastest by channel
No proactive alerts	Stockouts and problems only discovered when logging into platforms	Automated email alerts fire when stock is low, FBA is delayed, or sales drop
Manual reporting takes time	Owner time spent on reporting instead of sourcing inventory	Automated daily and weekly reports delivered on schedule
Channel comparison is guesswork	Unclear which platform generates the best ROI per category	Side-by-side channel performance comparison built in

RPR Automated — System Overview

RPR Automated connects to Jectronics' sales channels via their official developer APIs and pulls data into a centralized database. A Python-based processing engine handles profit calculations, inventory tracking, and FBA location management. A Streamlit web dashboard provides the visual interface, and a Claude AI chat interface sits inside that dashboard to answer questions in plain English. All software is open-source with no licensing fees.

What is Streamlit?

Streamlit is a free, open-source Python library that turns Python code into a professional web application automatically. Your RPR Automated dashboard runs in any web browser on any device. It does not require separate web development — the entire system, including the dashboard, is written in Python by the technical lead.

What is OpenClaw?

OpenClaw is a free, open-source autonomous AI agent that runs directly on your cloud server and connects through the business tools already in use — email, calendar, messaging apps, and file systems. It does not just analyze data; it takes action autonomously: executing workflows, sending alerts, generating reports, and responding to business conditions without manual input.

Unlike a workflow automation tool where you define every step upfront, an OpenClaw agent decides what to investigate and when. It reads your business data, reasons over it using Claude as its intelligence layer, and acts — sending alerts, writing reports, flagging anomalies, and surfacing insights that nobody explicitly programmed it to look for.

Example: The agent notices PS5 Controller sales velocity has increased 40% this week. Without being asked, it calculates days-to-stockout, checks FBA Available levels, and sends an alert — before the item hits any hardcoded threshold.

OpenClaw is adopted in Phase 2, after the Python data foundation is fully stable. This sequencing is intentional — the agent is only as useful as the data it reasons over, and that data layer must be correct first.

OpenClaw Security & Deployment

Because OpenClaw connects to email, marketplace accounts, and other business services, security is an important consideration. The following safeguards will be implemented for Jectronics:

- OpenClaw will be deployed on a DigitalOcean cloud server using a hardened, secure configuration — the server is not exposed to the public internet
- Marketplace API credentials are stored encrypted. OpenClaw operates with read-only access to sales data where possible — it reads and reports, it does not modify listings or transactions
- Access to the dashboard and the server is restricted to authorized users only, protected by password authentication
- The agent operates with narrowly defined tool permissions — it can send emails and read database data, nothing else. This limits the blast radius if anything unexpected occurs

- All agent activity is logged. Every action OpenClaw takes is recorded so it can be reviewed at any time
- Credentials — including the Claude API key and email authentication — are stored in OpenClaw’s secure configuration, never hardcoded in the codebase

What is Claude Code?

Claude Code is an AI-powered development tool used by the technical lead, Pakshal Gandhi, to accelerate the build of RPR Automated. It understands the entire codebase and works across multiple files simultaneously — writing integrations, fixing bugs, and generating database schemas from plain English descriptions.

Claude Code is not a client-facing part of the system — it is an internal development accelerator. Its impact on Jectronics is indirect but significant: it cuts the build timeline by an estimated 30–50%, allowing the team to deliver a more reliable system faster.

Where Claude Code Is Used	What It Does	Impact on Jectronics	Time Saved
Amazon SP-API Integration	Writes authentication, pagination, and error handling code across multiple files simultaneously	Faster, more reliable API connection from day one	Days → Hours
eBay Sell API Integration	Builds the full eBay data pipeline including order sync, fee extraction, and rate limit handling	Clean data flowing in from both platforms without manual debugging	Days → Hours
PostgreSQL Schema	Generates the entire database structure, migration scripts, and all queries from plain English	Accurate data storage from the start — no schema errors discovered late	Days → Hours
FIFO Profit Engine	Writes and debugs the complex lot cost logic across multiple SKUs and batch sizes	Profit numbers Jameson can trust from week one	Days → Hours
Streamlit Dashboard	Builds the full dashboard UI and updates it across all affected files instantly when changes are needed	Faster iterations if Jameson wants adjustments after seeing the system	Hours → Minutes
OpenClaw Configuration	Writes the agent tool definitions, memory configuration, and alert logic	Well-configured agent from the start — fewer early bugs	Days → Hours

The net result: the 6–7 week delivery window in the implementation timeline is achievable and realistic — Claude Code is a key reason why.

Technology Stack

Component	Tool	Purpose	Cost
Application & Dashboard	Python + Streamlit	The entire system runs in Python. Streamlit turns that code into a professional web dashboard accessible from any browser.	\$0
AI Chat Interface	Claude API (Anthropic)	Embedded directly in the dashboard. Ask RPR Automated questions in plain English and get answers from your own data.	~\$10–40/mo
Amazon Integration	Amazon SP-API	Official Amazon Selling Partner API — pulls orders, inventory, FBA data, and fees directly from Seller Central.	\$0
eBay Integration	eBay Sell API	Official eBay developer API — pulls orders, sold listings, and fees from the Jectronics seller account.	\$0
Database	PostgreSQL	Stores all sales, inventory, FBA movements, shipment costs, and profit calculations.	\$0
Scheduling	APScheduler (Python)	Built into the Python codebase — automatically syncs API data from Amazon and eBay on a timed schedule.	\$0
AI Agent Layer	OpenClaw (open-source)	Autonomous AI agent that runs 24/7, reasons over live business data, and proactively sends alerts and reports. Uses Claude as its reasoning engine.	\$0
Development Accelerator	Claude Code	Used internally by the technical lead to accelerate the build. Cuts build time by 30–50%.	\$0 (internal)
Server	DigitalOcean / AWS / Linode	Runs RPR Automated, PostgreSQL, and OpenClaw 24/7 in the cloud — no on-site hardware required.	\$18–24/mo

System Architecture

DATA SOURCES: Manual Shipment CSV Upload (Ryan Gallagher — lot costs, FIFO layers) + Amazon SP-API + eBay Sell API

↓

PYTHON BACKEND — API data collection (APScheduler), FIFO cost logic, FBA location tracking, profit calculations

↓

POSTGRES SQL DATABASE — inventory, sales, FBA batches, costs, fees

↓

OPENCLAW AI AGENT — runs 24/7, reads live data, reasons over it,

Key System Features

1. Multi-Channel Sales Dashboard

All sales channels pulled into a single view, updated automatically every few hours.

Channel	Today's Revenue	Units Sold	Month-to-Date
Amazon (MayflowerMobile)	\$1,840	42	\$28,400
eBay (Jectronics)	\$1,220	38	\$19,600
TOTAL	\$3,060	80	\$48,000

2. FBA vs. Warehouse Inventory Tracking

Every unit of inventory has a location status at all times. The dashboard always shows the full picture — never a single undifferentiated total.

Product	Warehouse	FBA Transit	FBA Available	Total	Alert
Xbox Controller (Renewed)	8	0	5	13	⚠ Restock
Apple Watch Band Bundle	4	0	2	6	🔴 Critical
Gaming Headset (Refurb)	22	0	14	36	✓ OK
Phone Case 10-Pack	0	0	3	3	🔴 Critical

Why this matters: A product showing 0 Warehouse stock and 30 FBA Available is not available to fulfill a direct eBay order. RPR Automated makes this distinction clear at all times so no sale is promised against stock already committed to Amazon.

3. True Profit Per Item — Resale Model

RPR Automated calculates profit correctly for every sale type — Amazon FBA, Amazon Direct, and eBay each have different fee structures and the system handles all three separately.

Cost Component	Description	Example (per unit)
Sale Price	Actual sale price on the channel	+ \$44.99
Acquisition / Lot Cost	Cost of the item from the lot — entered via shipment CSV	– \$9.00
FBA Fulfillment Fee	Amazon's per-unit fulfillment charge (FBA sales only)	– \$5.35
Channel Referral Fee	Amazon or eBay commission on the sale	– \$6.75
Shipping Cost	Own fulfillment cost (Direct sales only — FBA covered above)	– \$0.00
Net Profit	True per-unit profit after all costs	= \$23.89 (53% margin)

Because acquisition costs vary by lot, the system uses FIFO (First In, First Out) costing. Each shipment received is stored as a separate cost layer. When a sale occurs, the profit is calculated using the oldest available batch cost for that SKU — automatically, with no manual calculation required.

4. Channel Fee Comparison

Channel	Fee Type	Approx. Rate	Net on \$44.99 Item
Amazon FBA	Referral fee + FBA fulfillment fee	~15% + \$5.35/unit	~\$30.49
Amazon Direct	Referral fee only	~15%	~\$38.24
eBay	Final value fee	~13%	~\$39.14

5. Inventory Monitoring and Stockout Alerts

Product	eBay Stock	Amazon Stock	7-Day Sales Rate	Days to Zero	Alert
Xbox Controller (Renewed)	8	5	12/week	~9 days	⚠ Restock
Apple Watch Band Bundle	4	2	9/week	~5 days	🔴 Critical

Gaming Headset (Refurb)	22	14	8/week	~25 days	✓ OK
Phone Case 10-Pack	0	3	6/week	~4 days	● Critical

6. Claude AI Chat Interface

The Claude AI interface is embedded directly into the RPR Automated dashboard. It reads all of Jectronics' actual sales, inventory, and profit data and responds to plain-English questions in real time. No SQL, no pivot tables, no report builder.

AI Feature	What It Does	Example Output
Plain-English Q&A	Ask any question about your sales, inventory, or profit and get a direct answer from your own data	"What was my best-selling category on eBay last month?" → Gaming accessories, \$4,280 revenue, 41% margin
Automated Summaries	Reads your data and generates plain-English business summaries on a daily or weekly schedule	"Gaming accessories generated your highest margin this week at 48%. Apple Watch Bands are 4 days from stockout on eBay."
Anomaly Detection	Monitors for unusual changes in sales patterns and flags them without being asked	"Sales of Xbox Controllers dropped 60% on Amazon vs. last week — possible listing issue or inventory problem."
Sourcing Guidance	Analyzes which categories turn fastest and surfaces data-driven sourcing suggestions	"Electronics and gaming have the highest 7-day sell-through rate. Recommend prioritizing these in your next sourcing run."
Stale Stock Alerts	Identifies items sitting unsold beyond a configurable threshold and suggests action	"14 items have not sold in 60+ days across all channels. Consider repricing or cross-listing to eBay."
Channel Optimization	Compares same-SKU performance across Amazon and eBay and flags where to prioritize	"Phone cases sell 3x faster on eBay than Amazon. Consider shifting listing quantity to eBay."

7. Proactive Alerts & Anomaly Detection — Powered by OpenClaw

The OpenClaw agent monitors your business data continuously and decides what to flag — without being told what to look for.

Alert Type	What Triggers It	Example Email Subject	When Sent
Low Stock Warning	Warehouse stock falls below your set threshold	⚠ RTX 4060 — 8 units remaining	Daily
Critical Stockout	Any product hits zero units in warehouse	● Xbox Controller — OUT OF STOCK	Hourly

FBA Transit Delay	FBA shipment in transit longer than 7 days without Amazon confirmation	⚠ FBA shipment delayed — 9 days in transit	Daily
FBA Stock Low	Units at Amazon FBA fall below your set threshold	⚠ PS5 Controller — 3 FBA units left	Daily
Stale Inventory	Items unsold for 30, 60, or 90 days (your choice)	⚠ 5 items unsold for 60+ days	Weekly
Sales Anomaly	Revenue drops more than a set percentage vs. prior week	⚠ Amazon revenue down 40% this week	Daily
Daily Summary	Fires every morning regardless of alerts	RPR Automated Daily — March 8 Summary	Every morning

Example: Agent detects Amazon revenue is down 35% but eBay revenue is up 12%. Instead of firing a generic sales drop alert, it reasons the issue is channel-specific — likely a listing problem — and flags it with that context in the email.

8. Automated Reporting — Written by Claude, Triggered by OpenClaw

The OpenClaw agent pulls your data, sends it to Claude, Claude writes a plain-English report, and the agent delivers it on schedule. No manual reporting. No logging into platforms. Every report is contextual — written based on what actually happened, not a fixed template.

- Daily summary: total revenue, units sold, top item, and any critical stock alerts
- Weekly report: profit breakdown by channel, best-performing category, and inventory status
- Monthly report: full profit and loss summary, channel comparison, and trend analysis

9. Sales Velocity and Sourcing Insights

RPR Automated tracks how quickly different product categories sell across channels. This data is directly useful when deciding which types of lots to source next: which categories turn inventory fastest, which channels move specific categories best, which items have been sitting too long, and seasonal trends based on historical data.

Hosting, Access & Maintenance

RPR Automated runs entirely on a cloud server — no hardware purchase needed, no machine needs to stay on at the office.

Detail	Information
--------	-------------

Dashboard access	RPR Automated opens in any web browser — Chrome, Safari, Edge. No app to install. Works on desktop, laptop, tablet, or phone.
Who can access it	Anyone with the link and a password. Access is restricted to authorized users only.
Where it runs	On a cloud server that stays on 24/7. The owner does not need to have any computer turned on.
Updating the system	Updates are pushed remotely by the technical lead. No visits to the business premises required.
Database backups	Automated daily backups run on the cloud server. Data is never lost if something goes wrong.
Uptime	Cloud servers operate at 99.9%+ uptime. RPR Automated is available whenever you need it.
Maintenance	When Amazon or eBay update their APIs, the technical lead applies the fix remotely. No downtime for the business owner.

Recommended Cloud Server

Provider	Recommended Plan	Monthly Cost	Recommended
DigitalOcean	Basic Droplet — 2 vCPU / 4GB RAM / 80GB SSD	\$24/month	✓ Recommended
AWS Lightsail	2 vCPU / 4GB RAM	\$20/month	—
Linode / Akamai	2 vCPU / 4GB RAM Shared	\$18/month	—

Monthly Operating Costs

Component	Tool	Monthly Cost
Application & Dashboard	Python + Streamlit (open-source)	\$0
Amazon SP-API	Amazon official seller API	\$0
eBay Sell API	eBay official developer API	\$0
Database	PostgreSQL (open-source, on cloud server)	\$0
Scheduling	APScheduler — built into Python	\$0
AI Agent (OpenClaw)	OpenClaw (open-source, self-hosted)	\$0
Development Tool	Claude Code (internal build accelerator)	\$0

AI Chat Interface	Claude API — Light: \$10–25/mo; Typical: \$25–40/mo	\$10 – \$40
Cloud Server	DigitalOcean / AWS Lightsail / Linode	\$18 – \$24
Miscellaneous	Domain, email delivery, automated database backups	\$5 – \$10

Estimated total monthly operating cost: **\$33 – \$74/month**

For comparison, commercial multi-channel platforms like ChannelAdvisor or Linnworks charge \$500–\$1,500+ per month for similar functionality. RPR Automated delivers equivalent value at a fraction of the cost, with no recurring software licensing fees.

Pricing

Pricing has been calibrated to reflect Jectronics as a small, owner-operated resale business. These numbers are honest and based on the actual scope of work required.

RPR AUTOMATED — Full Automation Platform ★ Designed for Jectronics

One-Time Implementation	\$4,500
Monthly Maintenance & Support	\$350/month

What's included:

- Amazon and eBay API integration
- RPR Automated dashboard (Python + Streamlit) — accessible from any browser on any device
- FBA vs. warehouse inventory tracking with live location status
- True profit per item — all costs and fees, calculated automatically using FIFO costing
- Channel fee comparison (Amazon FBA vs. Direct vs. eBay)
- Category performance reports
- Real-time inventory monitoring and low-stock email alerts
- Claude AI — daily and weekly reports written in plain English, delivered automatically on schedule
- OpenClaw AI agent — autonomous reasoning, decides what to investigate and when
- OpenClaw AI — contextual anomaly detection with explanation
- OpenClaw AI — proactive sourcing insights based on live sell-through data

- OpenClaw AI — stale inventory detection (30/60/90 day flags)
- Claude AI chat interface — ask any question about your business data in plain English
- Sales velocity and category turnover tracking
- Seasonal trend analysis
- Cross-channel pricing analysis
- Priority support
- Ongoing maintenance and API updates

Implementation Timeline

The full project is structured in two stages. A Pre-Implementation Phase must be completed before any technical development begins.

Pre-Implementation Phase — Data Organization (Ryan Gallagher)

Task	Description	Led By
Warehouse Stock Audit	Document all current inventory — SKUs, product names, quantities on hand, and storage location for every item	Ryan Gallagher
Acquisition Cost Tracking	Record the cost paid per item or per lot for all current and incoming inventory so true profit can be calculated	Ryan Gallagher
Shipment CSV Build	Create consistently formatted shipment CSV files capturing stock levels and costs in the format RPR Automated can import directly	Ryan Gallagher
Cost Input Process	Define a repeatable process for updating the CSV each time new inventory is sourced so cost data stays current	Ryan Gallagher
Data Handoff	Pass the completed and validated data to Pakshal Gandhi for database integration	Ryan → Pakshal

Estimated duration: 1–2 weeks. Technical development does not begin until this phase is fully complete.

Main Implementation Phases — Technical Development (Pakshal Gandhi)

Phase	Key Tasks	RPR Automated Work	Duration
Phase 1 — Foundation	Review marketplace accounts. Document SKU structure. Import shipment	Python environment live. PostgreSQL schema created with FBA location tracking.	Week 1

	CSV data. Set up cloud server.	Streamlit dashboard functional.	
Phase 2 — API Integration	Connect Amazon SP-API. Connect eBay Sell API. Configure APScheduler for automated data sync.	Sales and inventory data flowing into PostgreSQL automatically from both platforms.	Weeks 2–3
Phase 3 — Profit Engine	Build profit calculation engine. Implement FBA vs. warehouse tracking. Validate all profit figures with Ryan.	FIFO cost logic working. FBA location tracking active. Profit calculated correctly per channel.	Week 4
Phase 4 — OpenClaw Agent	Install OpenClaw on cloud server. Connect to PostgreSQL and Claude API. Define agent goals, memory, and tools. Build alert and reporting behaviours.	OpenClaw agent live and reasoning over real data. Proactive alerts firing. Daily summaries and weekly reports delivered by Claude.	Weeks 5–6
Phase 5 — Full Features	Sales velocity tracking. Stale inventory detection. Claude AI chat interface in dashboard. Advanced sourcing insights.	Claude chat interface live. Agent expanded with sourcing guidance, anomaly reasoning, and cross-channel optimisation.	Week 7
Ongoing Maintenance	Monthly API monitoring. Bug fixes. Agent behaviour tuning. New features quoted separately.	Python backend and OpenClaw agent both maintained remotely. No visits to business premises required.	Monthly

Projected Return on Investment

Improvement Area	How It Helps a Resale Business	Conservative Estimate
Stockout prevention	Catch low inventory before sales are lost — no reorder option makes proactive alerts more valuable	+3–8% revenue retained
Unprofitable lot identification	Some lots look good but margin disappears after fees — identify and avoid these quickly	+5–12% net profit improvement
Stale inventory reduction	Move slow stock faster with visibility into what hasn't sold in 60+ days	10–15% less capital tied up
Time savings	No more logging into platforms daily to check sales	5–10 hours/week recovered
Better sourcing decisions	Data shows which categories turn fastest and generate best margins	Compound margin improvement over time

Illustrative ROI Scenario

Using conservative public estimates of Jectronics' revenue (~\$250,000–\$400,000 across all channels annually):

Metric	Conservative Estimate	With RPR Automated (Conservative)
Annual Revenue (all channels)	\$300,000	\$315,000 (+5%)
Net Profit Margin	18%	21% (+3 pts from fee/cost visibility)
Annual Net Profit	\$54,000	\$66,150
Profit Improvement	—	+\$12,150/year

First-year investment: $\$4,500 + (\$350 \times 12) = \$8,700$

Conservative net benefit in Year 1: **\$12,150 – \$8,700 = \$3,450 net gain**

From Year 2 onward (maintenance only): **\$12,150 – \$4,200 = \$7,950 net annual benefit**

Risks & Honest Limitations

Risk	Details	How We Handle It
OpenClaw platform maturity	OpenClaw is a relatively new open-source tool with a large community but still developing production documentation.	Python foundation built first in Phases 1–3. OpenClaw only introduced in Phase 4 once data layer is stable. Fallback options exist including manual alerting via APScheduler.
API access requirements	Each marketplace requires seller API access to be enabled — Amazon SP-API requires developer registration	Guided setup during Phase 1 — most approvals are straightforward for active sellers
Variable acquisition costs	Resale lot costs change frequently; wrong inputs mean wrong profit numbers	System supports per-batch cost updates via shipment CSV — owner controls this directly
API rate limits	All APIs have request frequency limits	Data collected on scheduled intervals — not real-time — to stay within limits
API changes by marketplace	Platforms update their APIs periodically	Covered under monthly maintenance — updates applied as needed
Agent behaviour unpredictability	Unlike fixed workflows, an agent makes its own decisions — harder to test exhaustively	Agent introduced after data layer is validated. Behaviour monitored closely in first 30 days.
Scope changes	New feature requests after launch	Clearly scoped upfront. Changes quoted separately to avoid surprise costs

Recommended Next Steps

Project Team

Team Member	Role	Responsibilities
Rayhan Khan	Project Lead & Technical Support	Client relationship, proposal, project management, system design, and assistance with basic technical needs throughout the project
Pakshal Gandhi	Technical Lead	Primary technical implementation including API integrations, database build, Python/Streamlit build, Claude AI integration, OpenClaw configuration, dashboard development, and ongoing system maintenance
Ryan Gallagher	Pre-Implementation Lead	Warehouse stock audit, acquisition cost tracking, and building the shipment CSV data system required before technical development can begin

Step	Action	Time Required
1	30-minute discovery call — review marketplace accounts and confirm API access availability	30 minutes
2	Confirm product cost tracking method — how acquisition costs are currently recorded	10 minutes
3	Select cloud server preference (DigitalOcean recommended)	Owner decision
4	Sign service agreement and begin Pre-Implementation Phase	1–2 days
5	RPR Automated live and delivering reports	6–7 weeks from start

Conclusion

Jectronics LLC has built a strong multi-channel resale operation over nearly two decades, with a reputation for quality service across eBay and Amazon. The business is well-positioned to improve its margins and operational efficiency with a system that finally answers the core questions every resale seller needs to know:

- What is actually making money after all fees and costs — by item, by channel, by category?
- What is about to run out of stock, and is that stock in my warehouse or already at Amazon FBA?
- Which channel and category should I prioritize for my next sourcing run?

RPR Automated answers these questions proactively — sending email alerts before problems become losses, and delivering daily summaries every morning without requiring the owner to log in. When something needs attention, RPR Automated tells you. When you want to dig deeper, the dashboard and AI chat interface are there.

RPR Automated has been designed specifically for a small, owner-operated resale business — not an enterprise retailer. The pricing reflects that. The system is built in Python using open-source tools, runs at under \$74/month in operating costs, and is designed to be maintained without ongoing dependency on expensive third-party platforms.

The Claude AI chat interface means the owner does not need to become a data analyst to get value from the system. Ask a question, get an answer. That is the promise of RPR Automated.
